

The Report of Symposium in Strasbourg

At University of Strasbourg, 1 July 2009 ~ 2 July 2009

Yasuaki Kakikura

Department of Applied Chemistry, Graduate School of Engineering

The candidate participated in a symposium titled “Chemistry at the Frontiers of Biology and Physics”. The conference focused on recent findings and noteworthy studies by leading chemists from Osaka and Strasbourg University, and I joined a poster session to give a presentation about my research.

This symposium offered me many insights in lecture sessions. The contents of the symposium were really stimulating because the presenters showed me not only present results about their research field but also their perspective for potentials and developments of chemistry. It encouraged me to advance my own research.

In the poster session, some participants were interested in my presentation about functional hemoprotein assembly on gold electrode toward a functional biointerface. To tell the truth, sometimes it was a little tough for me to explain my research for a person who studies on a different field. However, I took the time to explain the content of my poster, and finally I had meaningful discussion. It was fruitful opportunity for me to present my research result and discuss with many researchers, especially students of the same generation.]

I appreciate GCOE program of Osaka University, which is one of the organization that supported this symposium and gave the financial support to me, as well as Strasbourg University who showed us a great hospitality.
